

Goals from last week:

Start on milestone/sprint 3

Figure out when we will start the code

What we've done:

1. Created a level 1 diagram that include app features
2. Created models to give an idea of all objects we'll need
3. Decided which associations the models need
4. Updated all lo-fi prototypes to include functions names, view names, route actions, and database field names for input fields

What worked:

Meeting together during class time, using discord, splitting the work between each of us, allowing extra time to complete tasks, and scheduling another meeting to go over everything

What we learned:

We learned the difference between context diagrams and level 1 diagrams

We learned about models and associations

Learned about databases and how to interact with SQLite

Where we had trouble:

Had some trouble with understanding the difference between DFD and level 0 (not realizing it was a typo).

Struggled some with figuring out what models and associations were.

Given the amount of work due this week, we ran into some time issues and had to schedule a third meeting this week.

Where we're stuck:

Not currently stuck anywhere.

Agenda for next meeting:

BDD and testing?

Meeting next week:

Tuesday we will plan our meeting for Thursday
